Task 1 - QA Report

Name: Shreya Singh

App: Conduit (RealWorld demo app), github.com/realworld-apps/realworld

Browser: Chrome

About my testing

This was my first time testing a website properly, so I kept it simple. Conduit is a small blogging site, kind of like Medium, where you can make an account, write articles, add tags and comment on posts. I just used it like a normal user would and went through the main things one by one: sign up, log in, write an article, add tags, edit it, delete it, comment, delete the comment and then log out.

Writing, editing and deleting an article worked fine, and logout also worked. The problems I found were mostly in the sign up page and in deleting or removing things. Whenever something looked wrong I wrote down what I did and took a screenshot. I found 6 issues in total, listed below.

Bug Report

Severity: Critical, High, Medium, Low

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	Same email works for two different accounts	1. Signed up as user a with email a 2. Logged out 3. Signed up again as user b, same email a	**Expected:** Some error like "email already registered" **Actual:** No error at all. It just made a second account with the same email	High	Looks like the site doesn't check if the email is already used before making the account
2	Sign up takes a fake email and a 1 letter password	1. Went to Sign up 2. Username: a 3. Email: notanemail (no @) 4. Password: 1 5. Clicked Sign up	**Expected:** It should tell me the email is wrong and the password is too short **Actual:** Account got made and it logged me in directly (Screenshot 1)	High	No checks on the form for email format or password length
3	Couldn't find any way to delete my comment	1. Logged in 2. Opened my article 3. Posted a comment 4. Looked for a delete option on it	**Expected:** A delete button on my own comment **Actual:** Nothing was showing on my comment (Screenshot 2). I tried pressing Tab too, it never went to any delete option	Medium	I think delete is just a small trash icon with no text, and on my laptop the icons didn't load, so it didn't show at all

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
4	Can't remove a tag once it's added	1. Clicked New Article 2. Typed qa and pressed Enter 3. Typed demo and pressed Enter 4. Tried to remove qa	**Expected:** A small x on the tag **Actual:** No x, so I had no way to remove the tag (Screenshot 3)	Medium	Probably same reason as bug 3, the remove option is only an icon
5	Wrong login message is not clear, and there's no Forgot password	1. Went to Sign in 2. Typed an email that isn't registered and some random password 3. Clicked Sign in	**Expected:** Something like "wrong email or password" and a Forgot password link **Actual:** It only says "credentials invalid". No Forgot password link anywhere, so if you forget it you're stuck (Screenshot 4)	Medium	Message is too short/technical, and there's no reset password option
6	Sign in button stays grey and doesn't say why	1. Went to Sign in 2. Left the boxes empty (or filled just one) 3. Tried clicking Sign in	**Expected:** Some message telling me what's missing **Actual:** Button is just grey and nothing happens when I click. Same on Sign up	Low	Button is disabled till all boxes are filled but no hint is shown

Root Cause Analysis - Bug 2

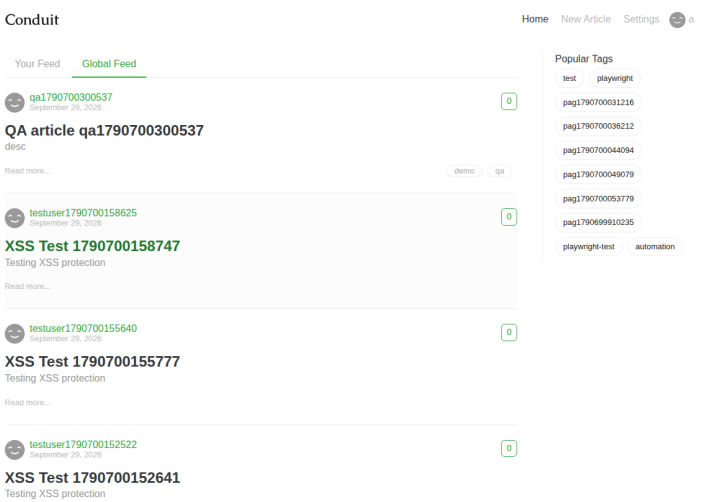

I picked bug 2 because it was the first thing I noticed. On the Sign up page I typed "notanemail" as the email and "1" as the password, and it still made my account and logged me in. No error came up at all.

From what I understand, the form only checks that the boxes aren't empty. As soon as all three have something in them, the Sign up button turns green and you can click it. The site also saves whatever you send, so the wrong email and weak password get through.

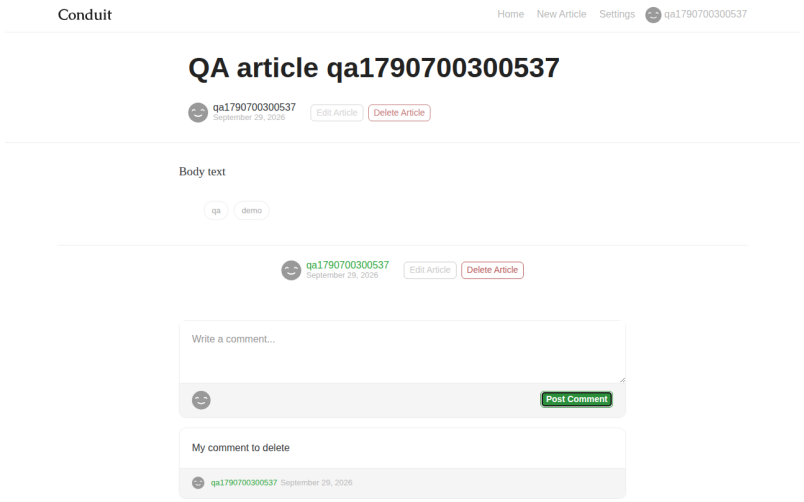

This is a problem because if someone makes a typo in their email, like forgetting the @, they won't know. Later they can't get any mail from the site or get their account back. And a 1 letter password is really easy for someone to guess.

To fix it, the form should check that the email has an @ and a proper domain (like gmail.com), and that the password is at least 8 characters. If something is wrong it should show a red message under that box, for example "Please enter a valid email". The site should also do the same check on its side, so wrong data can't be saved even if someone skips the form.

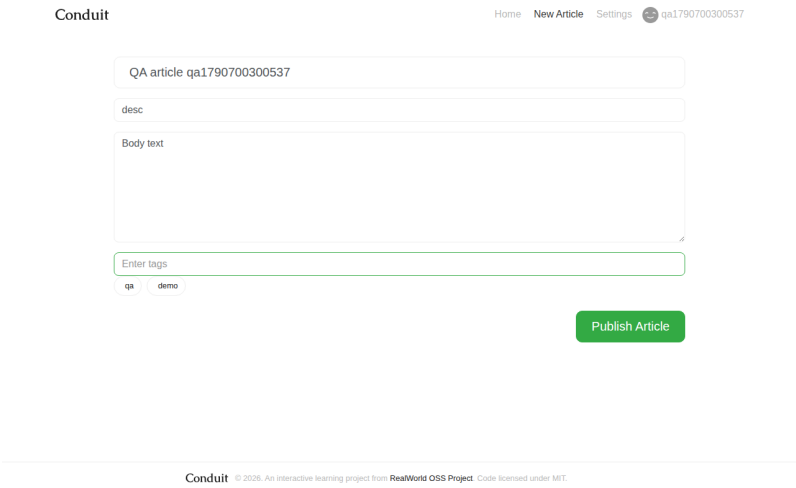

Screenshots

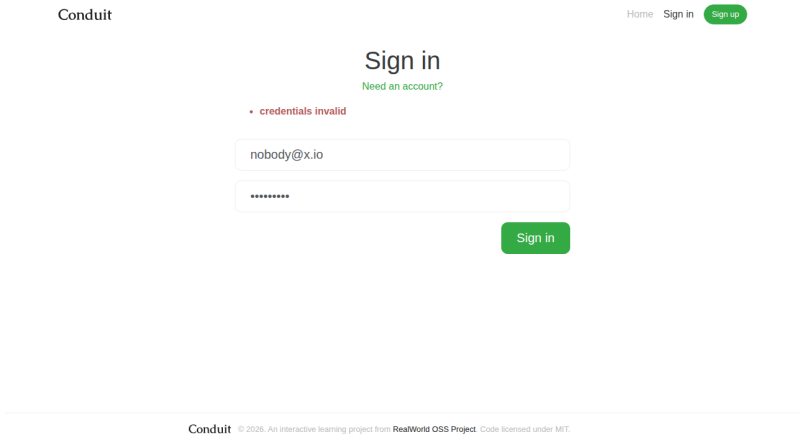

Screenshot 1 - Signed up with email "notanemail" and password "1". Account created and logged in as "a" (top right)

Screenshot 2 - My comment at the bottom. No delete option is showing

Screenshot 3 - Tags "qa" and "demo" added. No x to remove them

Screenshot 4 - Wrong login only says "credentials invalid". No Forgot password link
